

# Is it Pollution or is it Fertilizer?

Reason Rising 2020 #5

Dare reason that fertilizer is helping the world become greener

## Alarmist Mindset

Knows the world will pollute and overheat. Has seen similar pictures of pollution pouring into the atmosphere.

- Imagines the atmosphere is loaded with pollution.
- Knows that pollution is causing all weather and global warming because people of authority said so.

## Reasoned Mindset

Knows the world is greening according to NASA satellite data.

Understands that this is **steam**.

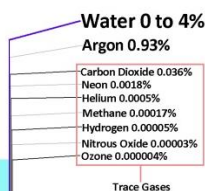

- Recognizes that the first image was sepia toned for dire effect.
- Realizes that rain washes pollutants out of the air which are eaten by trillions X trillions of natural microbes and converted into fertilizer.

## Atmospheric Gases

We call this air

**Nitrogen 78.08%**

**Oxygen 20.95%**

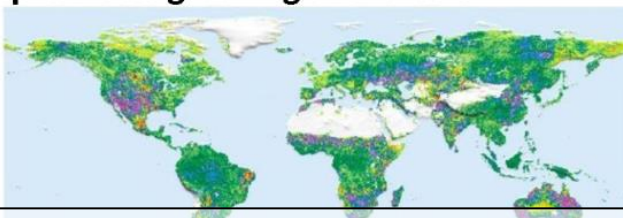

These measurements are a constant, meaning that overall we do not see pollution loading.

The truth is that we live in a recycling behemoth called Earth. The atmosphere is a giant mixmaster where a dizzying array of temperatures and gases mix and rain cleans and Earth recycles.

Nobody can fully explain the process but we do know that life is thriving on this planet, which we will explore in subsequent issues.....

**Fossil Fuels are a net positive. Their use promotes greening of the earth.**

Reasoning rules out a climate emergency.
